

GRAY FOUNDRIES
WEIGHING OF INDIVIDUAL COMPONENTS FOR THE PRODUCTION OF A GRAY CAST IRON MIXTURE

PLATFORM SCALES | KERN EOE

In metallographic terms, cast iron is a mixture of iron, lamellar graphite, tempered carbon, silicon, manganese and sulfur. The material properties of the various types of cast iron are determined by a precisely defined amount of the individual components. Therefore, these individual components should be weighed very carefully. Only precise handling guarantees a flawless product and avoids complaints

Model	Weighing capacity	Readability	Price
